

## Example 4

As shown in the figure,  $ABCD$  is a parallelogram. Draw a circle using  $A$  as the center and  $AB$  as the radius to meet  $BC$  at  $G$ ,  $AD$  at  $F$ , and the extension of  $BA$  at  $E$ . Show that  $EF = FG$ .

Solution: Connect  $AG$ .  $AB = AG$ .  $\angle B = \angle AGB = \alpha$ .  
 Since  $BC \parallel AD$ ,  $\angle B = \angle EAF = \alpha$  and  $\angle AGB = \angle GAF = \alpha$ .  
 Thus  $\angle EAF = \angle GAF$  and they face the equal arcs or chords.

So  $EF = FG$ .
