

## Example 2

In an acute triangle  $ABC$ ,  $BE$  is the altitude and  $CF$  is the median.  $\angle ACF = 30^\circ$ . Which of the following is true about the relationship of  $BE$  and  $CF$ ?

- (A)  $BE > CF$
- (B)  $BE = CF$
- (C)  $BE < CF$
- (D)

Solution: (B).

Take  $D$ , the midpoint of  $AE$ . Connect  $FD$ .  $FD \parallel BE$  is the midline of triangle  $ABE$ , with  $FD \perp AC$ .

Therefore,  $FD = \frac{1}{2}BE$ .

In right triangle  $CDF$ , since  $\angle ACF = 30^\circ$ ,  $FD = \frac{1}{2}CF$ .

Thus  $FD = \frac{1}{2}BE = \frac{1}{2}CF \Rightarrow BE = CF$ .  
 The answer is (B).
