

Problem 8

Problem

As shown in the figure, $AB \parallel CD$. $AD \perp AB$. AD and BC meet at E such that $EB = 2AC$. Show that $\angle ACD = 3\angle BCD$.

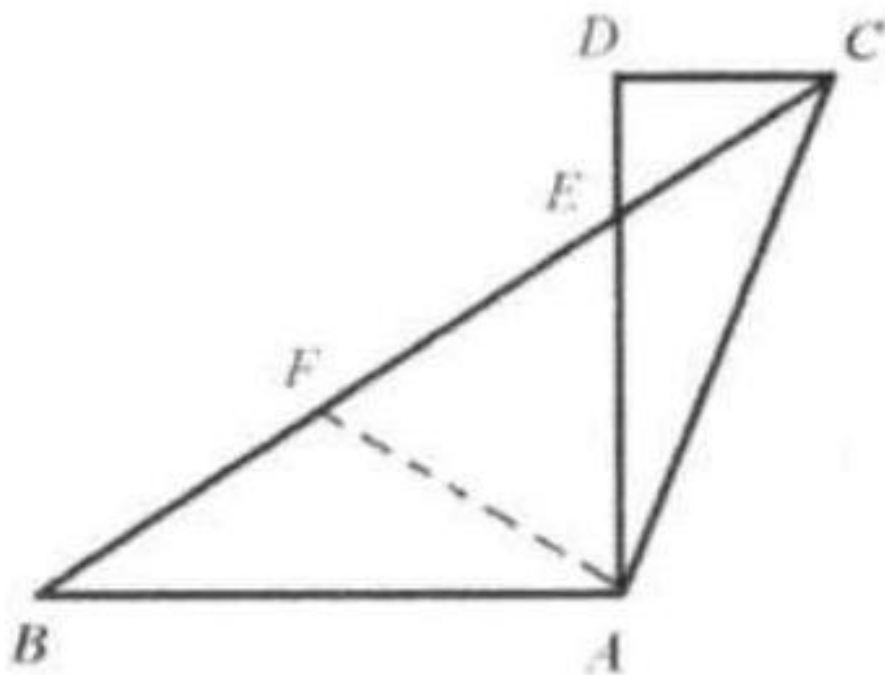

Solution

Draw AF , the median of right triangle BAE . Since AF is the median, by Theorem 1.3, $AF = BF = AC$.

Thus $AF = AC$.

Thus both triangles AFB and CAF are isosceles triangles.

Let $\angle B = \angle FAB = \alpha$.
 $\angle CFA$ is the exterior angle of triangle ABF . So $\angle CFA = \angle ACF = 2\alpha$.
 Since $AB \parallel CD$, $\angle B = \angle DCE = \alpha$.
 $\angle ACD = \angle ACF + \angle DCE = 3\alpha = 3\angle BCD$.
